

CMPS 2680 Homework 5

Fall 2024

Organizing Content

- [CSS Display](#)
- [CSS Dimensions](#)
- [CSS Positioning](#)
- [CSS Navigation Bar](#)
- [CSS Flexbox](#)
- [CSS Grid](#)

Going Horizontal 2.0:

If you want block elements on a page to appear horizontally, instead of vertically, you have 3 options:

1. **float: left;**

Pros: Doesn't require container, fully backwards compatible, ignores white space

Cons: Clearing floats can be confusing, not easy to center blocks

2. **display: inline-block;**

Pros: Easier than float to work with, don't need to use clear

Cons: Elements won't naturally float around it, does NOT ignore white space in code

3. **display: flex;**

Pros: MUCH easier to work with, new features added, can easily center blocks

Cons: Not supported by legacy browsers, requires an outer container
